WEEK 12

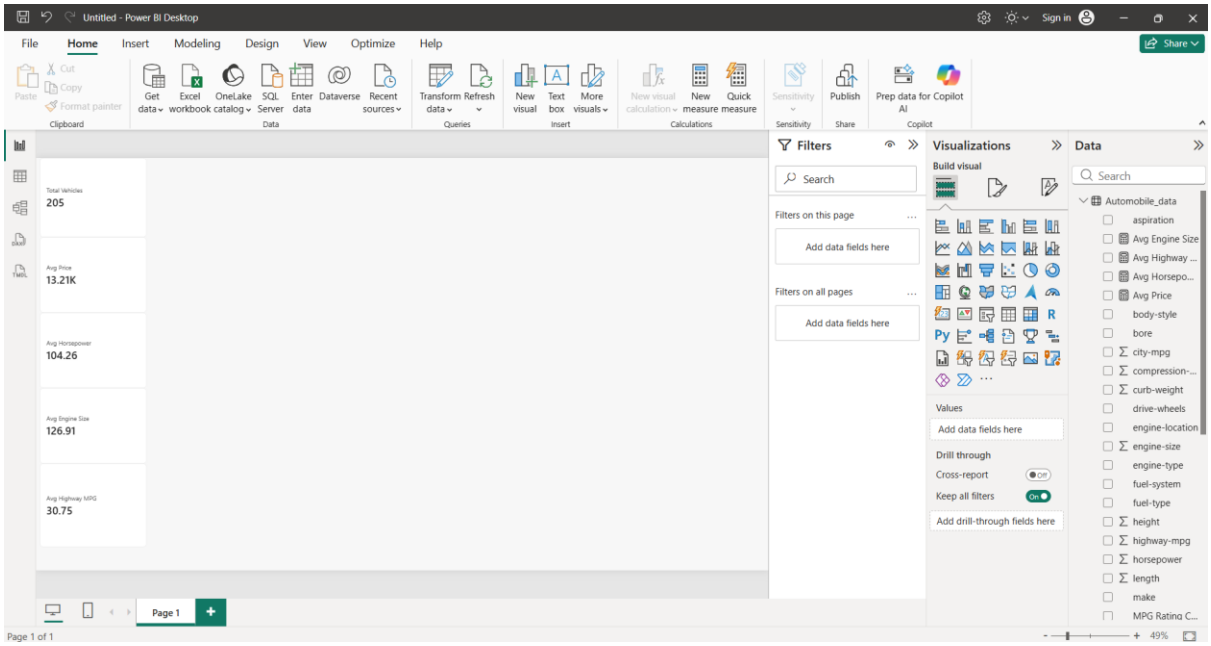

SAI SHRUTI B

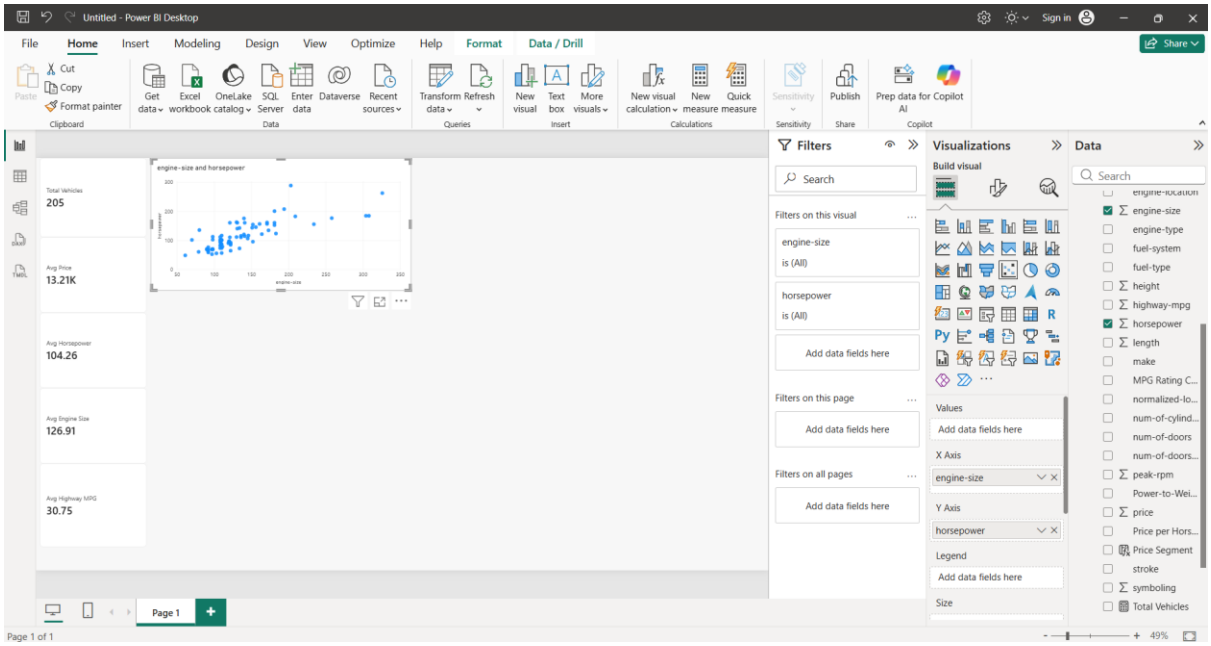

A calculated column named Price Segment was created using the DAX SWITCH and TRUE() functions. Vehicles were classified into Budget, Mid-Range, Luxury, and Unknown categories based on their prices.

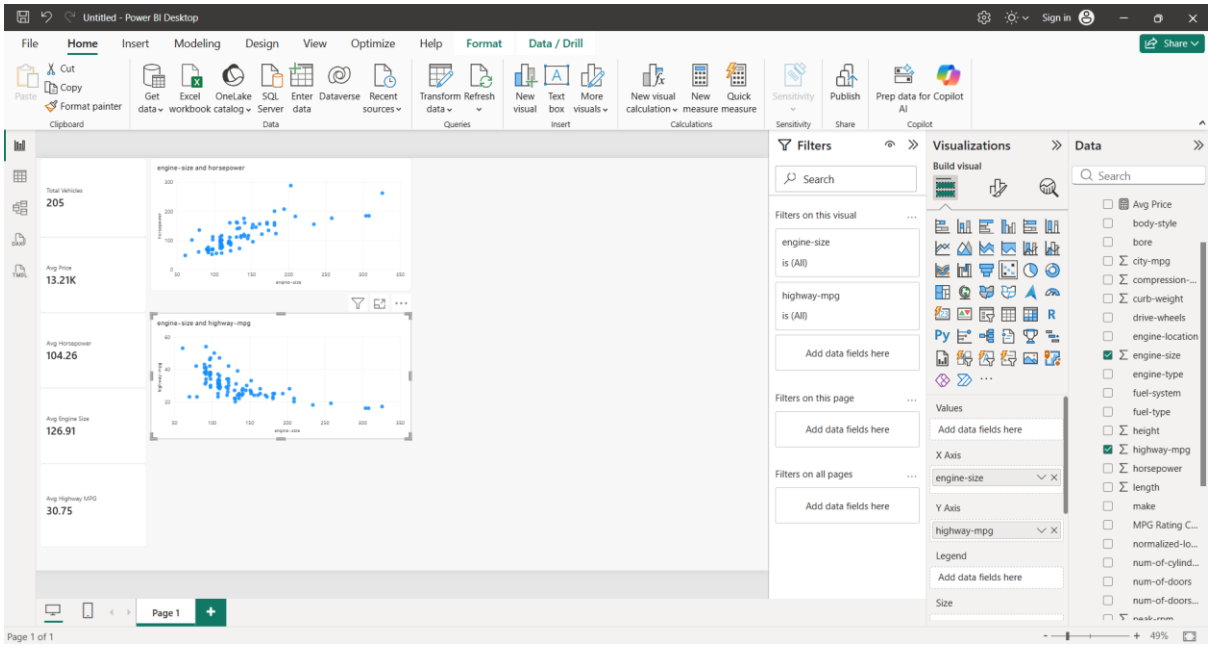

A DAX measure named Total Vehicles was created using the COUNTROWS() function to calculate the total number of vehicle records in the automobile dataset.

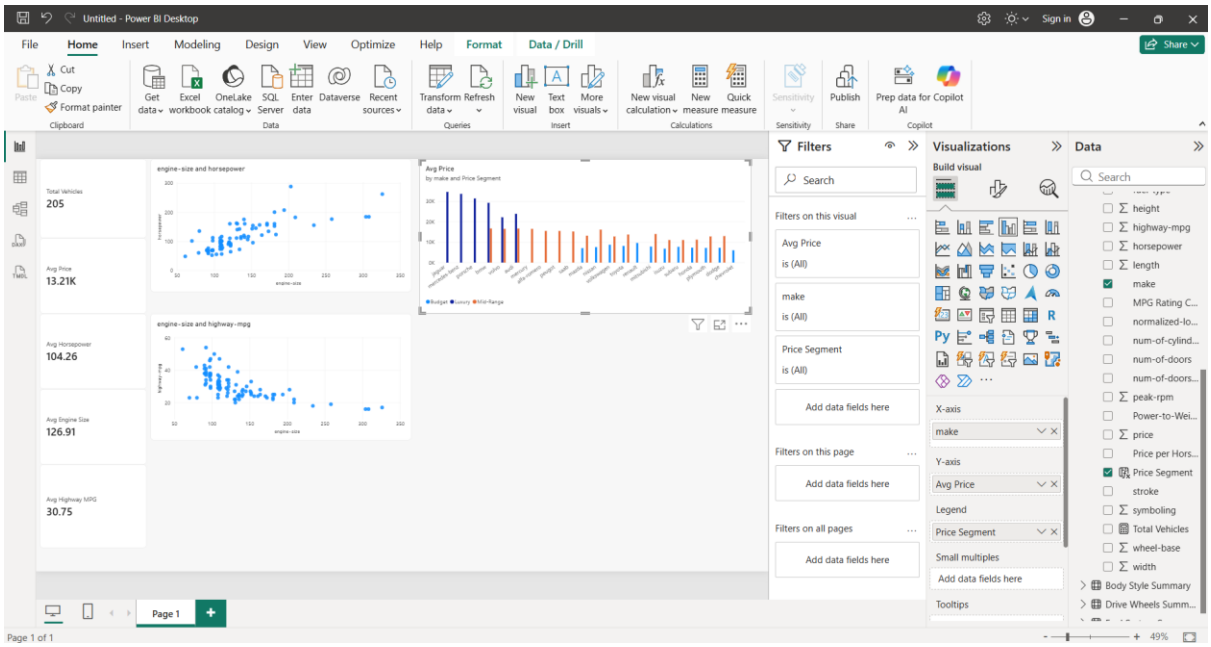

Five Card visuals were added to the report page to display the key automobile statistics: Total Vehicles, Avg Price, Avg Horsepower, Avg Engine Size, and Avg Highway MPG.

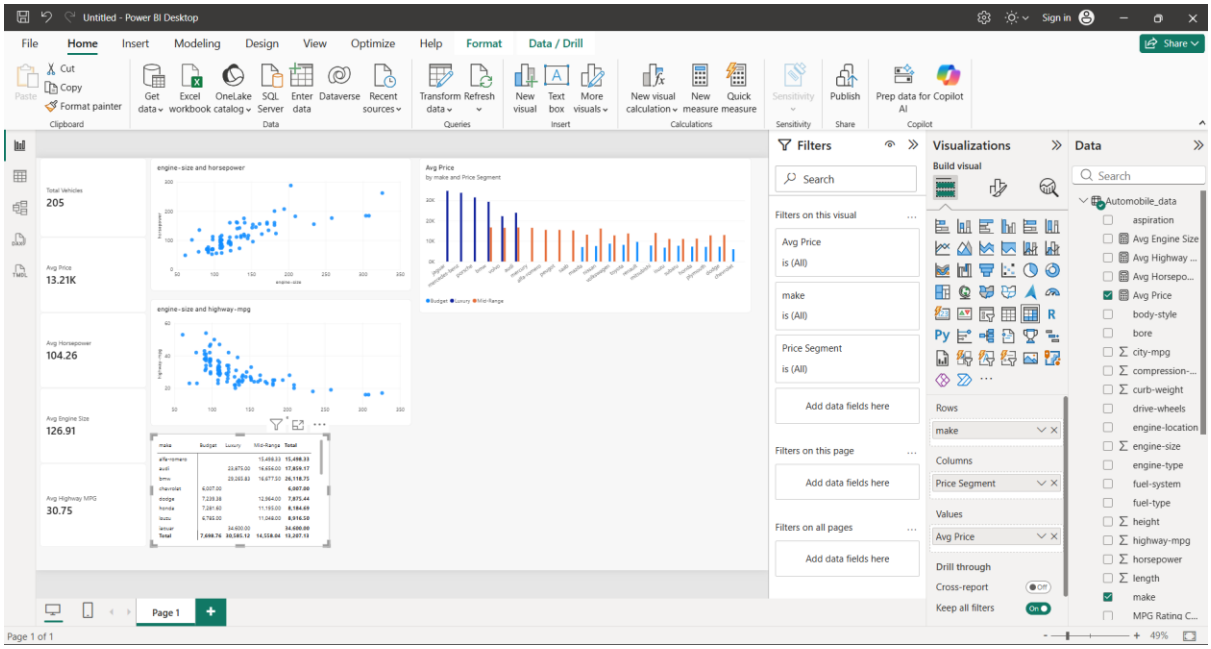

A scatter chart was created using engine-size on the X-axis and horsepower on the Y-axis. It helps analyse the relationship between engine size and horsepower across vehicles.

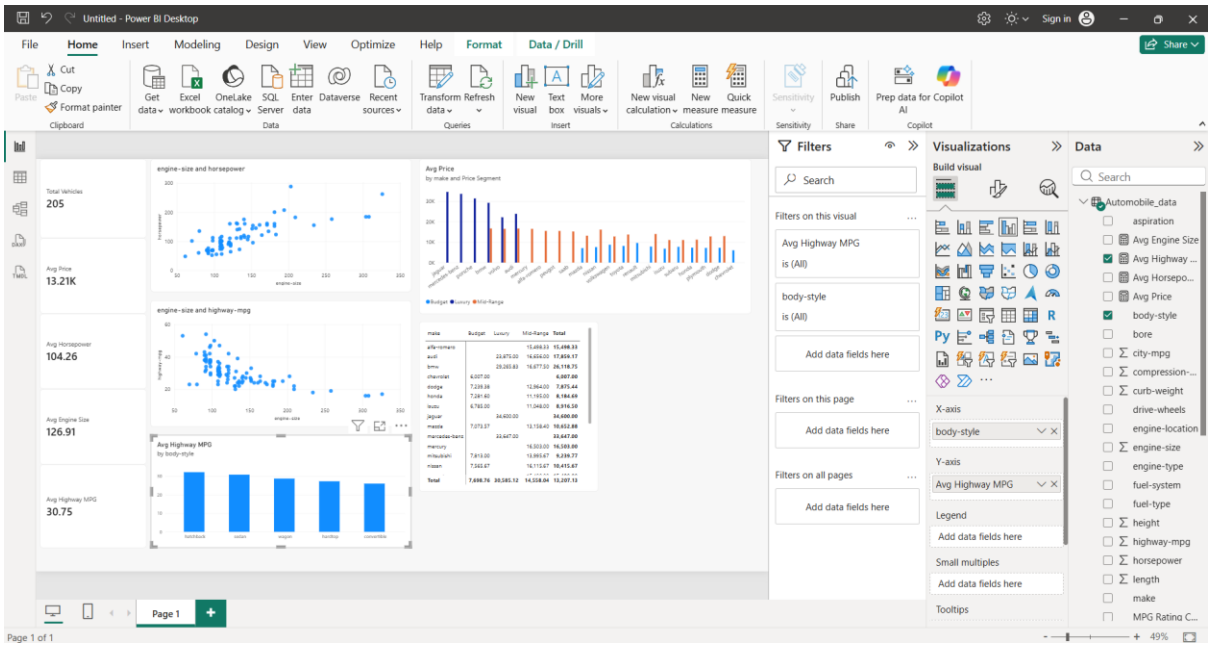

A second scatter chart was created using engine-size on the X-axis and highway-mpg on the Y-axis. It helps examine how engine size relates to highway fuel efficiency.

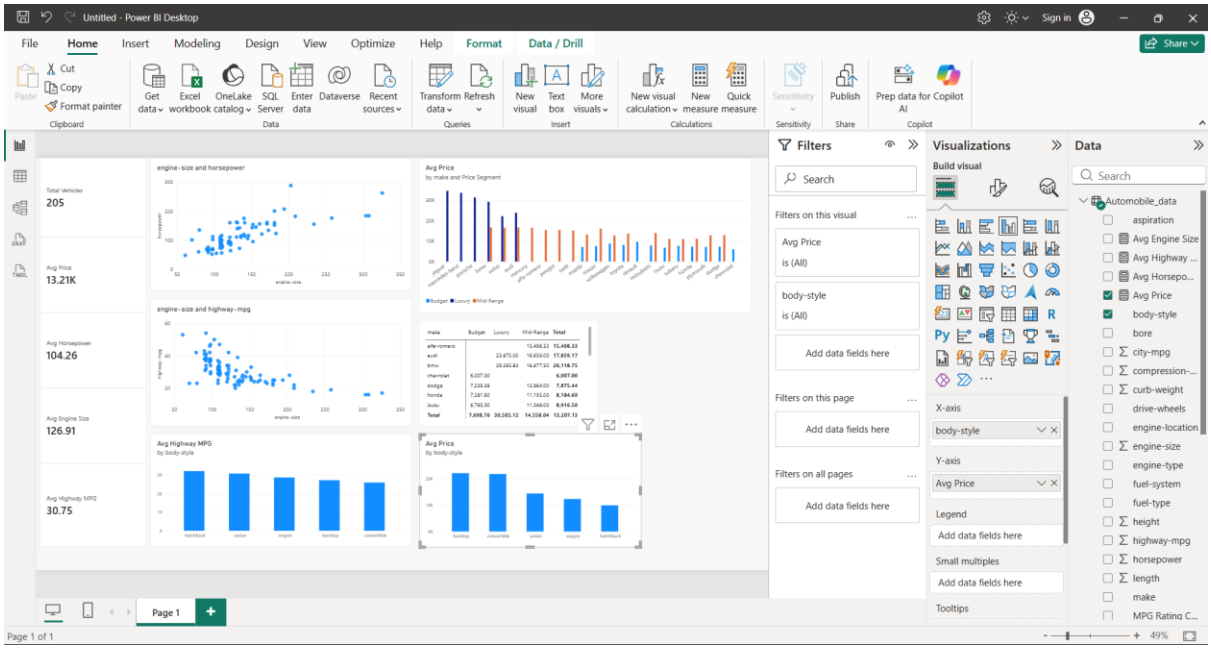

A clustered column chart was created using make on the X-axis, Avg Price on the Y-axis, and Price Segment as the legend. This visual compares manufacturers across different price categories.

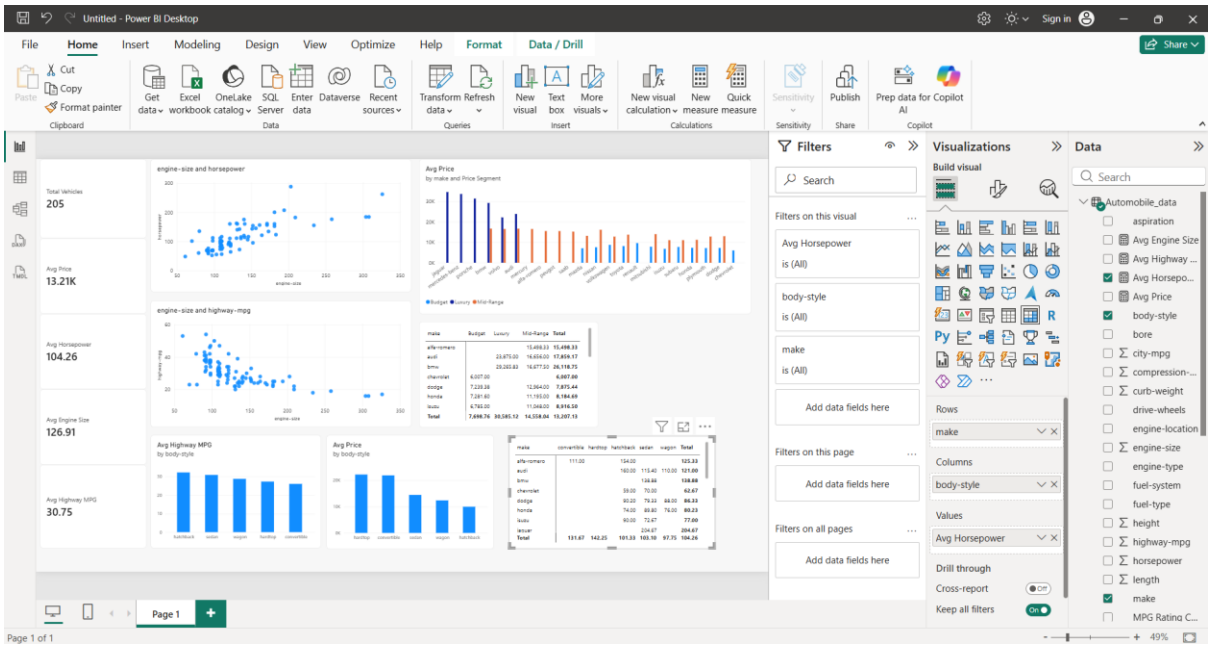

A Matrix visual was created with make in Rows, Price Segment in Columns, and Avg Price in Values. It displays the average price of vehicles from each manufacturer across the different price segments.

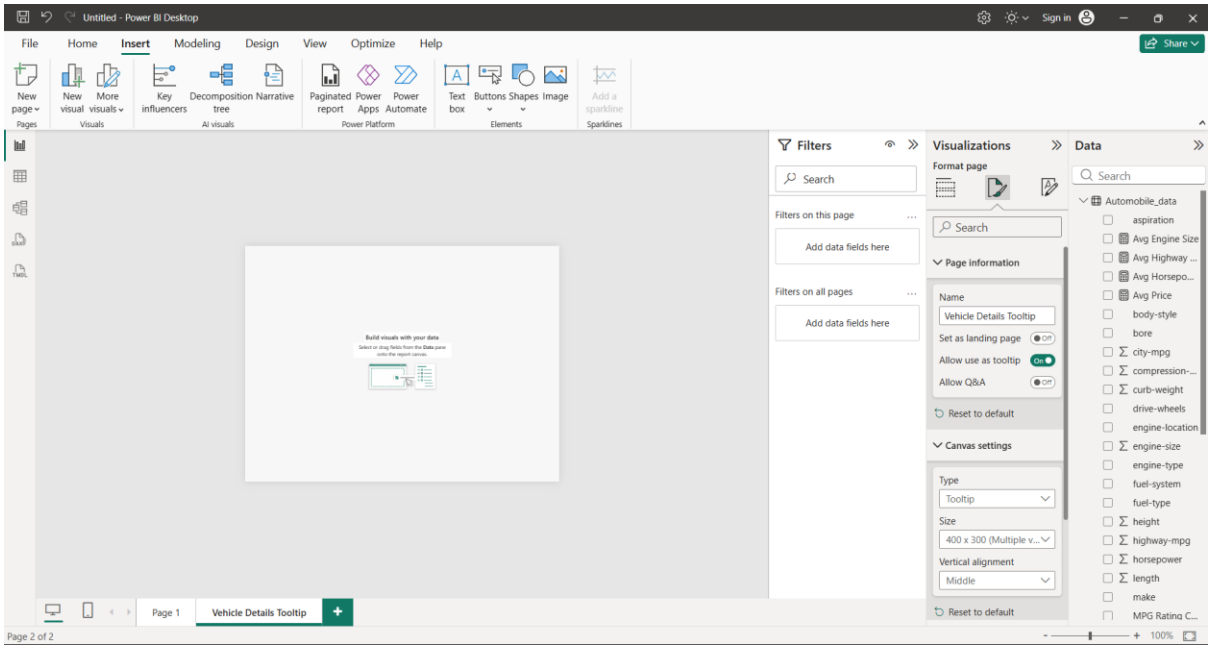

A clustered column chart was created using body-style on the X-axis and Avg Highway MPG on the Y-axis. This visual compares the highway fuel efficiency of different vehicle body styles.

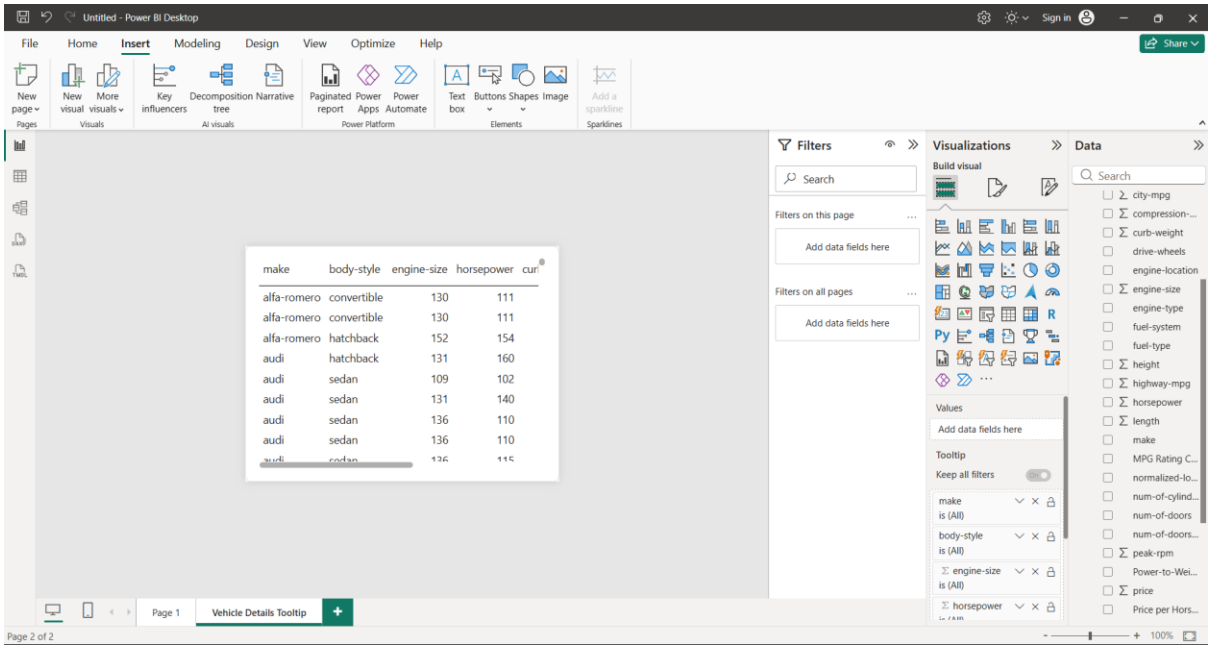

A clustered column chart was created using body-style on the X-axis and Avg Price on the Y-axis. It helps compare the average prices of vehicles across different body styles.

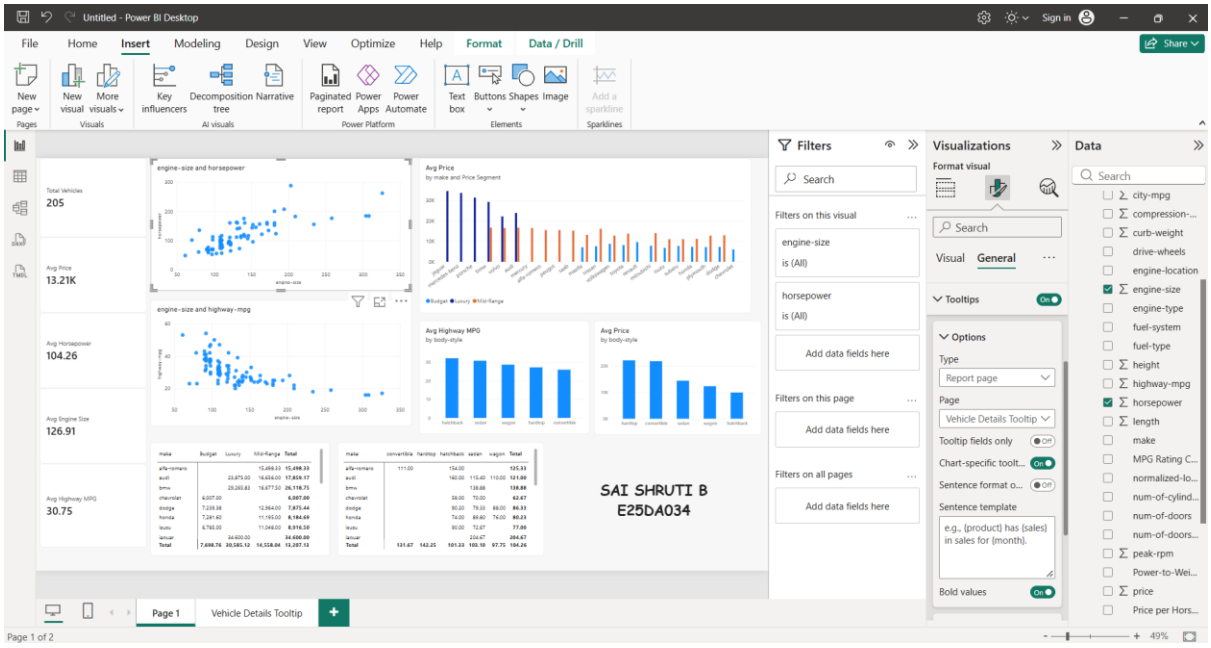

Another Matrix visual was created using make in Rows, body-style in Columns, and Avg Horsepower in Values. It provides a comparison of average horsepower across manufacturers and vehicle body styles.

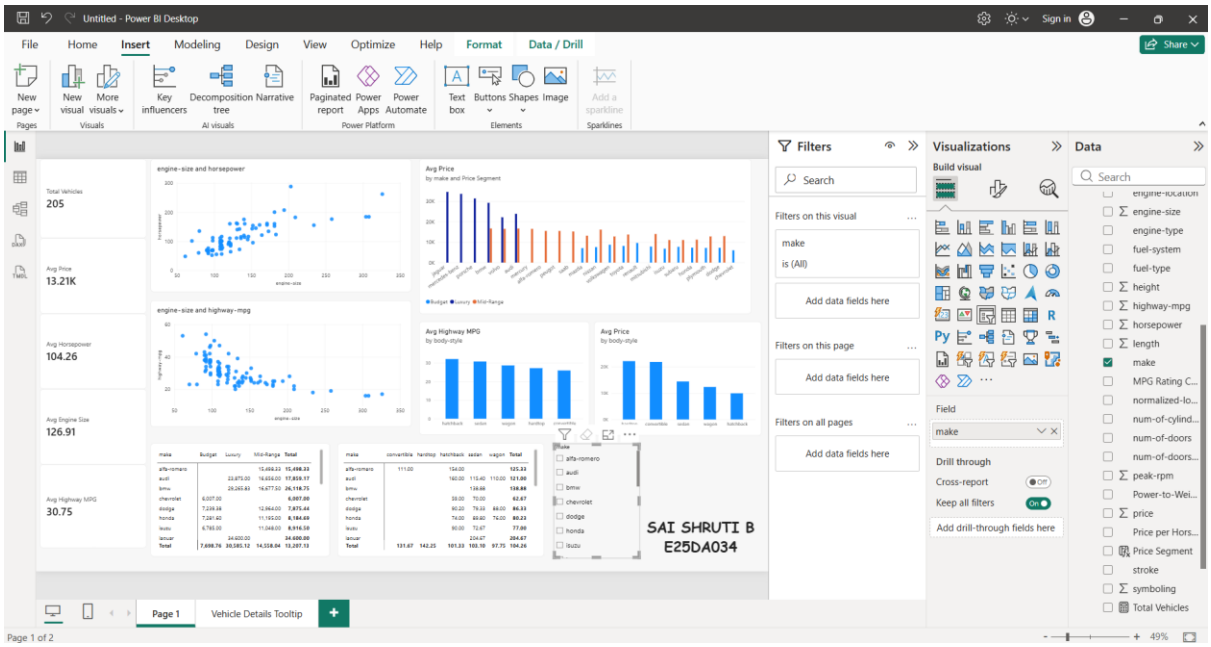

A separate report page named Vehicle Details Tooltip was created. The Allow use as tooltip option was enabled, and the page type was changed to Tooltip.

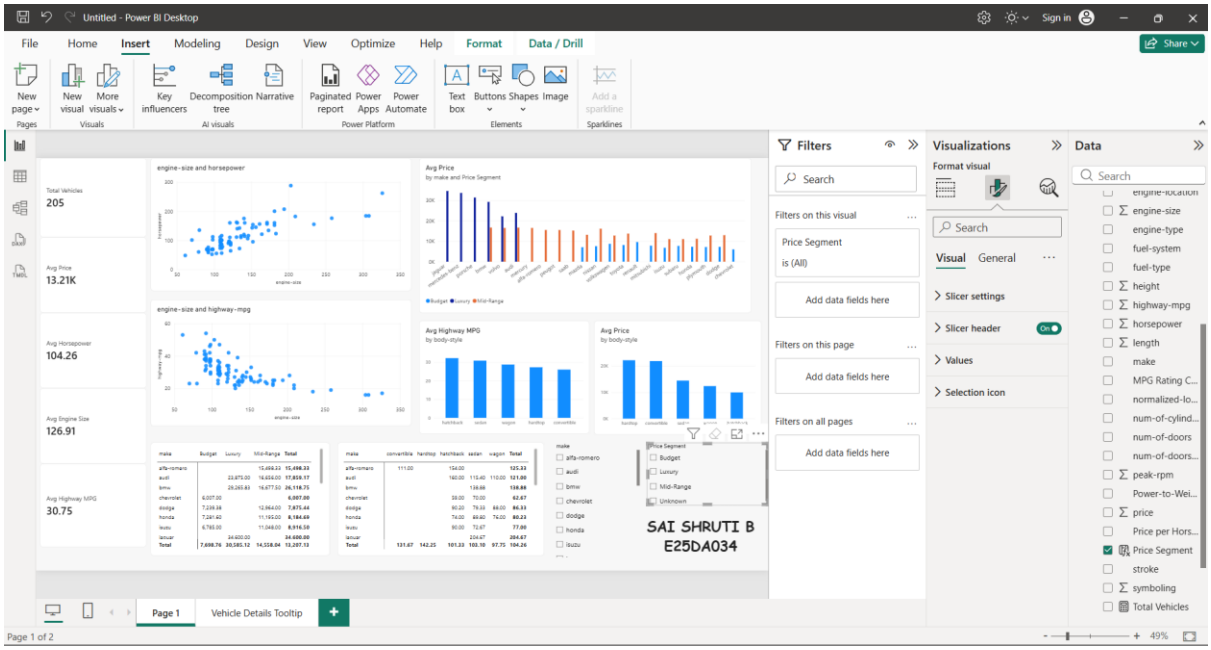

A Table visual was added to the tooltip page to display individual vehicle specifications, including manufacturer, body style, engine size, horsepower, and other vehicle details.

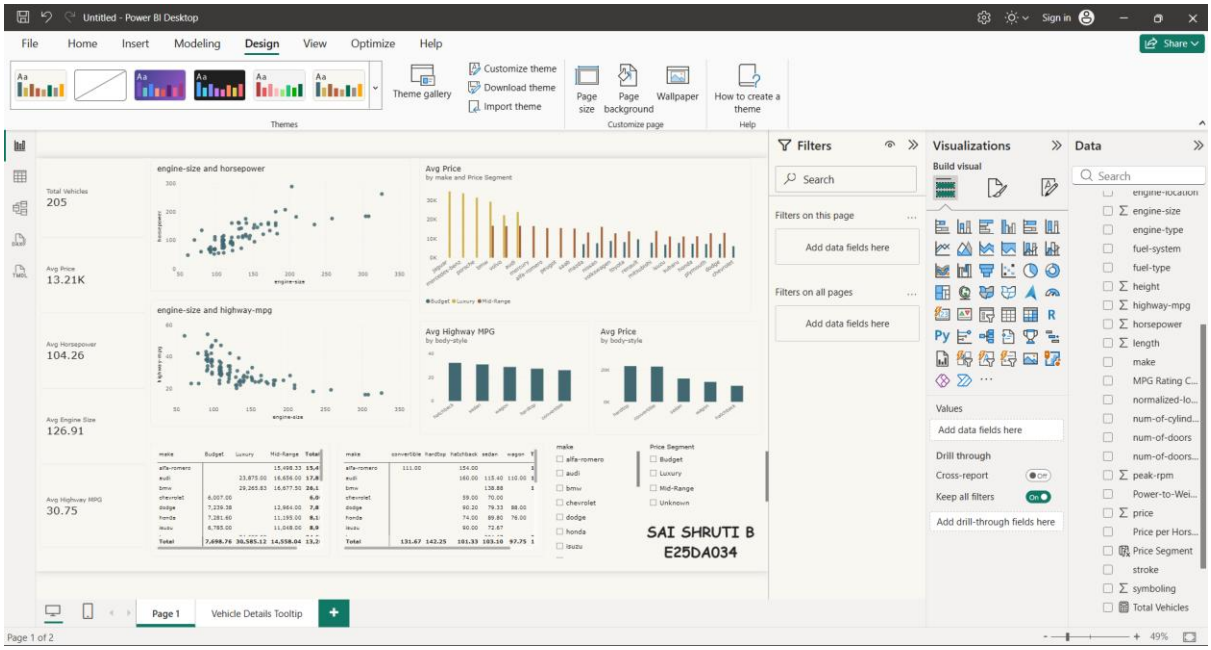

The Vehicle Details Tooltip report page was selected as the custom tooltip for the Engine Size vs Horsepower scatter chart. This allows additional vehicle information to be displayed when hovering over a data point.

A slicer using the make column was added to the dashboard. It allows users to select individual automobile manufacturers and filters the report visuals accordingly.

A second slicer was added using the Price Segment column. It allows users to filter the dashboard by Budget, Luxury, Mid-Range, and Unknown categories.

The final dashboard brings together the five KPI cards, scatter plots, manufacturer price comparison chart, body-style comparison charts, matrix visuals, and interactive slicers. A consistent theme and layout were applied, along with the student identification text, to complete the Automobile Analytics Dashboard.
